

Deployable electric propulsion

Arc's propulsion system moves over a hundred vessels across the country. The platform scales from 200 kW to 10+ MW and deploys quickly across asset types, delivering continuous power with no thermal throttling or degradation. The full platform is engineered in-house and delivered as an integrated asset or a stand-alone platform. Because we interface with every layer, support is direct and on-site, with no vendor hand-offs.

Power
200 kW - 10+ MW

Energy source
Full battery-electric to primary combustion-electric

Drive
All electric propulsion

Redundancy
Parallelized drives and motors
