

Unifying software layer

Right now, Arc’s software is monitoring the performance over a hundred vessels on the water. Our integrated software system isolates faults, anticipates maintenance, and surfaces issues before they become problems. Every sub-system is digitally controlled, so operators can monitor and optimize entire fleets from one interface. We write every layer, from operating system to user interface, so nothing depends on a third party.

Controls

Centralized, full-stack authority

Fault handling

Automatic isolation and early warning

Telemetry

10,000+ data points a second

Monitoring

Remote, fleet-wide
